Canadian Data Report of
Fisheries and Aquatic Sciences
No. 522

86-01725/

## Canadian Data Report of Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of data reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Numbers 1–25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26–160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was introduced with the publication of report number 161.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

## Rapport statistique canadien des sciences halieutiques et aquatiques

Les rapports statistiques servent à classer et à archiver les compilations de données pour lesquelles il y a peu ou point d'analyse. Ces compilations auront d'ordinaire été préparées à l'appui d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 25 de cette série ont été publiés à titre de relevés statistiques, Services des pêches et de la mer. Les numéros 26 à 160 ont été publiés à titre de rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 161.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

## Abstract

Johnstone Strait chum test fishing catch data for 1965-1984 in British Columbia.

## RÉSUMÉ

Le présent rapport présente des données sur la pêche expérimentale du saumon kéta dans le détroit Johnstone (Colombie-Britannique) recueillies de 1965 à 1984.

## Introduction

Purse seine test fishing for abundance of migrating fall chum salmon is conducted in southern British Columbia each year. This report summarizes detailed catch data on the chum test fishing program in the upper and lower regions of Johnstone Strait (Figure 1).

The report provides daily catch data, summarized weekly catches and collates sampling frequency by seine set at each location.

### Upper Johnstone Strait

The upper Johnstone Strait test fishery conducted in statistical Area 12 was initiated in 1965 (Figure 2). Test fishing was initially conducted in conjunction with an extensive tagging program (Anderson and Beacham, 1983). Standardized methods for test fishing in specific locations were developed during the years of tagging (1965 - 1970).

Test fishing, until 1980, was conducted primarily in years of low abundance beginning in the fourth week of September. During many of the early years, the test program was discontinuous and was dependent on the number of commercial fishing openings. Since 1980 the upper Johnstone Strait test fishing has been initiated during the early part of September and continued until late October regardless of stock size and potential commercial fisheries. A minimum test fishing of three days per week with five sets per day has been conducted at specified locations.

Anderson (1975) outlines the analysis of catch data and the basic method for in-season prediction of stock abundance.

### Lower Johnstone Strait

The lower Johnstone Strait chum test fishing in Area 13 was initiated in 1978 (Figure 3). To assess the abundance of chum salmon migrating through Johnstone Strait and into the Strait of Georgia area test fishing begins in late September and continues until late October. A minimum test fishing of three days per week with four to five sets per day has been conducted at specified locations.

## Method

### Data Collection

Test fisheries in both upper and lower Johnstone Strait were conducted aboard a commercial salmon seine vessel on charter to the Department of Fisheries and Oceans.

A Department of Fisheries and Oceans employee was onboard the vessel to collect and record all catch data.

Set locations were generally determined following a preassigned and standardized list of fishing sites. Alteration of test fishing sites due to adverse weather and tide conditions were reviewed by both the skipper and the D.F.O. representative and the site adjusted accordingly. In most cases, catch is estimated while the seine net is "pursed up" without bringing the catch on board, although certain seine sets are landed, the catch counted to verify the estimating procedure and sold to pay for the charter.

The purse seine net is an "inside" fall chum seine which measures 400 metres in length and 52 metres in depth. Mesh size of the net measures no less than 70 millimetres (diagonal stretch). The length of time for each seine set ranged between ten and twenty minutes and is recorded in the data. Analysis of the data is calculated on an average catch per set per day basis (i.e. total catch of chum per day divided by the number of sets per day).

## Report Organization

The data in this report is organized in two sections (upper [Area 12] and lower [Area 13] Johnstone Strait). Each section has three tables for each year. The first table describes annual chum catches by week with the number of sets. The second table shows the frequency of each seine set made at a particular locality. The third table is the raw data taken from the seine catch data sheets, included are setting times, catch of other salmon species and key code. The function of the key code is to categorize a particular seine set's catchability performance. There are three codes: "0" code denotes set not completed due to a major problem and, hence, no catch (i.e. broken line, net in propellor, etc.); "1" denotes set completed with minor problems and partial catch (i.e. roll up, net partially collapsed, etc.); and "2" denotes a set was completed with no problems. Data records with "0" key code are not included in the summary tables.

## Acknowledgements

Over the period 1965 to 1984, numerous Department of Fisheries and Oceans personnel have been directly or indirectly involved with the chum test fishing program in Johnstone Strait, thanks is extended to all of these people. Industry skippers and crews involved in the program are specially thanked. The authors feel especially indebted to Mr. James Sewid and his family for their collective experience and integrity through the years of their involvement with upper Johnstone Strait test fishery.
